

Product Name	<b>KPV PEPTIDES</b>
Indication	Vaginitis
Description	This proprietary peptide is aimed to develop for the treatment of inflammatory vulvovaginal candidiasis. It is a synthetic octapeptide with a cysteine disulfide linkage connecting the two tetrapeptide monomers. The discovery of KPV peptide is based upon the biological activity of the endogenous peptide hormone, melanotropin or $\alpha$ -MSH. The microbiological activity can be applied to a number of therapeutic settings where topical treatment of infection is desired.
