

## **Yallaferon**

*Yallaferon* is a proprietary preparation of interferon for topical use developed by the Group's research team. *Yallaferon* possess broad spectrum anti-virus activities and is indicated for a variety of dermatological diseases caused by virus infection, including but not limited to condyloma acuminata (genital warts, being a kind of wart) and herpes.

*ZHAOKE Yallaferon* has successfully completed clinical studies organized by Beijing Medical University The First Hospital for treatment of labial and genital herpes, and genital warts as well as for the prevention of genital warts recurrence. Presently, two other clinical studies are on process for the treatment of zoster herpes and cervicitis.

Prior to the launch of *ZHAOKE Yallaferon*, the available route of administration on interferon for treatment of viral infection is by way of injection only. However, for diseases, such as genital warts, which is superficial and spot-focused in nature, it is difficult to apply high enough concentration of interferon locally by way of systemic injection without causing significant side effects. *ZHAOKE Yallaferon*, which is in gel form, can be applied locally and directly to the infection site. Echoed with the relevant endorsement by Anhui Province Drug Administration in the form of public advertising materials, *ZHAOKE Yallaferon* which is produced in topical gel form is the first of its kind in the PRC produced for commercial use for the treatment of genital warts.
